

Amphibian

Amphibian

Amphibians are vertebrates that live both in water and on land. They have a life cycle that includes both aquatic and terrestrial stages. They have gills as larvae and lungs as adults. They have moist skin that allows them to breathe through their skin. They are cold-blooded and have a three-chambered heart. They are found in a wide variety of habitats, including forests, swamps, and mountains.

Amphibian

Amphibians are a diverse group of animals that have adapted to live in both aquatic and terrestrial environments. They are found in a wide variety of habitats, including forests, swamps, and mountains. They have a life cycle that includes both aquatic and terrestrial stages. They have gills as larvae and lungs as adults. They have moist skin that allows them to breathe through their skin. They are cold-blooded and have a three-chambered heart. They are found in a wide variety of habitats, including forests, swamps, and mountains.
